September 2026 Logistics Manager's Index Report®

LMI® at 70.2

Growth is INCREASING AT AN INCREASING RATE for: Inventory Levels, Inventory Costs, Warehousing Utilization, Transportation Utilization and Transportation Prices

Growth is INCREASING AT A DECREASING RATE for: Warehousing Prices and Transportation Utilization

Warehousing Capacity and Transportation Capacity are CONTRACTING

Capacity is down sharply (-14.2) to contraction at 39.3 – which is the fastest rate of contraction for this metric since March of 2022 when supply chains slammed to a halt due to the invasion of Ukraine. This is one of the fastest rates of contraction that we have ever measured for Warehousing contraction. A potential explanation for this is that firms – particularly retailers – had run inventory down a bit and are not rushing goods in now ahead of potential holiday sales. Interestingly, most of these inventories seem to not have reached retailers yet but are instead sitting at the wholesale level. Often, we see inventories transfer from the wholesale to retail level around mid-October. The reduction in available storage capacity has boosted (+4.7) Warehousing Utilization to 64.3 and is likely behind the consistently (-1.5) robust expansion of 73.5 in Warehousing Prices. We see similar dynamics in Transportation Capacity, which are back down (-5.6) to a steep rate of contraction at 34.4. Transportation Utilization continues expanding at 66.1, but at a slower (-4.5) rate than last month. Finally, Transportation Prices continue to surge (+2.7), coming in at 92.7 which is the fifth time in the last six months this metric has read in over 90.0.

University, Colorado State University, Florida Atlantic University, Rutgers University, and the University of Nevada, Reno, and in conjunction with the Council of Supply Chain Management Professionals (CSCMP) issued this report today.

Results Overview

The LMI score is a combination of eight unique components that make up the logistics industry, including: Inventory Levels and Costs, Warehousing Capacity, Utilization, and Prices, and Transportation Capacity, Utilization, and Prices. The LMI is calculated using a diffusion index, in which any reading above 50.0

March of 2022. This month's reading is well above the all-time average of 61.8. As discussed above, the rapid movement in the logistics industry can largely be traced to a general tightness in available physical logistics capacity and the associated high disruption-driven costs. Aggregate Logistics Costs, which are an aggregation of Inventory Costs, Warehousing Prices, and Transportation Costs and runs on a scale from 0-300 with 150 being "breakeven" level, are up (+2.5) to 246.1 this month. This is the highest reading for this aggregate metric since April of 2022, when supply-driven inflation was rampant in the wake of both the cessation of COVID-era demand and the invasion of Ukraine.

These high costs are putting significant pressure on supply chains and consumers alike. Two major instruments measuring Consumer sentiment dropped in September. The University of Michigan's Survey of Consumers dipped 7.0% month-over month and 12.7% year-over-year to 48.1. This was driven by darkening views regarding current and future finances, as well a concerns over price growth and future inflation[1]. The Conference Board's consumer confidence index read in at 81.9 in September, which is the lowest reading for this metric since April of 2014. These respondents also cited a deteriorating economic situation and persistent inflations as leading factors behind their pessimism[2]. The dip in consumer sentiment is reflected in the weaker-than-expected job growth of 29,000 in September. The previously reported gains in July and August (the latter of which had been a standout month) were also revised down by a combined 60,000 positions[3]. We also saw that U.S. job openings were down by 256,000 month-over-month. This drop was driven largely by declining openings in professional and business services as well as healthcare[4]. The jobs report drove Wall Street close to all-time highs on Friday as the slowing job market makes it much less likely that the Fed will raise rates at their October meeting. Traders had been expecting the Fed to raise rates again as they did at their previous meeting. There is still a

above the Fed's overall inflation preference of 2% year-over-year growth. Fuel costs, transportation services, and the cost of goods and services were significant contributors to this increase. On the other hand, soft employment, along with the fact that a significant level of inflation is being caused by issues with demand instead of supply, suggests that rate increases may be counterproductive. One factor that may make it easier to hold rates steady is the revision to U.S. Q2 growth, which was revised to 2.2% - a significant improvement from the 1.5% expansion that had been reported previously. This was driven largely by a 0.7% increase in consumer spending from Q1. A surge in exports acted as a headwind[6] – some of which was driven by manufacturers stocking up on components ahead of potential tariffs, and some of which was driven by an expectation of a strong consumer. This upwards revision, along with the Fed raising interest rates in September for the first time in three years[7], likely provides some cover to hold rates steady later this month.

The U.S. is not the only economic power dealing with inflation. The Eurozone reported consumer price increases of 3.8% year-over-year in September, which is the fastest rate of inflation for the bloc since September 2023. This expansion was largely driven by the crunch on fuel, as consumer energy prices are up 18.8% year-over-year. This is just short of the highest-ever spike for Euro energy, behind only the period immediately following the cessation of Russian natural gas imports following the invasion of Ukraine[8].

This inflation is also apparent in Inventory Costs, which are up (+1.3) to 79.9, which is their second fastest rate of expansion since August 2025. The continuous increase in costs have led some consumers to report buying-ahead on large durable goods now in anticipation of further price increases down the road[9]. The types of goods being purchased has shifted as well, as increased

forced labor practices – are consistent with constitutional requirements[11]. In other tariff-related news, the official state visit between China and the U.S. during September resulted in a agreement to lower tariffs on approximately $60 billion of goods. The U.S. will reduce tariffs for seasonal items like toys and holiday ornaments, while China has agreed to reduce import costs for a variety of agricultural and medical device products. Interestingly, the list of semi-exempted items did not include “sensitive” products such as rare-earth minerals, chips, or other goods critical to the development of AI[12]. China’s economic position seems to be strengthening on a few fronts. A combination of their continuous investment in vehicle electrification and willingness to draw on their large strategic oil reserves have allowed them to avoid some of the recent crunch in energy costs[13]. At the same time, in September they reported moderate expansion in factory activity for the first time in three months as the Chinese manufacturing PMI read in at 50.1 (+0.3), which may be an indicator of increased future orders from U.S. importers.

Higher imports would be consistent with current Inventory Levels, which are up (+6.1) to 58.9. The increase in Inventory Levels is disproportionately driven by Upstream respondents, who report more robust expansion at 61.4 than their Downstream counterparts at 53.8. This dynamic likely represents a combination of goods being rushed over late due to late-breaking confidence in Q4 consumer spending along with the neo-seasonal trend to only move goods down to retailers in mid-October. Firms have not finished building up inventories for the end of the year, as imports are predicted to continue coming in strongly over the next month. The Port of Los Angeles is expecting imports of containerized TEUs to be up 50.66%, 51.18%, and 55.29% year-over-year over the last week of September and first two weeks of October[14]. This is a significant departure from 2025, when the majority of imports had been pulled

The surge in inventories was clearly reflected in storage metrics, as Warehousing Capacity dropped precipitously (-14.2) to 39.3, which is its fastest rate of contraction in four and a half years. Consistent with dynamics in Inventory Levels, Warehousing Capacity is tighter Upstream, contracting more quickly at 36.8 than the 46.2 reported Upstream. We observe similar dynamics when evaluating respondents by size, as smaller firms reported Warehousing Capacity contracting at 36.0 to 44.1 for larger firms. As might be expected given these differences, Warehousing Utilization rose significantly faster Upstream, with respondents reporting robust expansion at 68.4 – striking a sharp contrast with the more moderate increase of 53.8 reported Downstream. In our respondents base the smaller respondents tend to be located more at the wholesale than retail level. Taken together these metrics further support the proposition that a mass amount of inventory is coming into the U.S. but is mainly sitting Upstream at the wholesale level ahead of the shift toward retailers that we often see during October. As would be expected given these dynamics, Warehousing Prices continue to expand (-1.5) at the robust rate of 73.5. As has been discussed in many recent LMI reports, increasing costs are partly a function of limited capacity and difficulty of adding supply. It is then interesting that the U.S. shed 4,100 warehousing jobs in September. With this downward movement warehousing is now down 21,600 jobs year-over-year, and 107,000 off of their all-time peak in March 2022[15]. This long-term contraction may be representative of the fear of over-investing in physical capacity after so many firms got burned in 2022 and beyond bey having an excess of supply.

Transportation Capacity also continues contracting (-5.6), reading in at 34.4. However, unlike warehousing, and in spite of the disappointing overall jobs report, the transportation sector added 2,600 jobs in September. This pushed

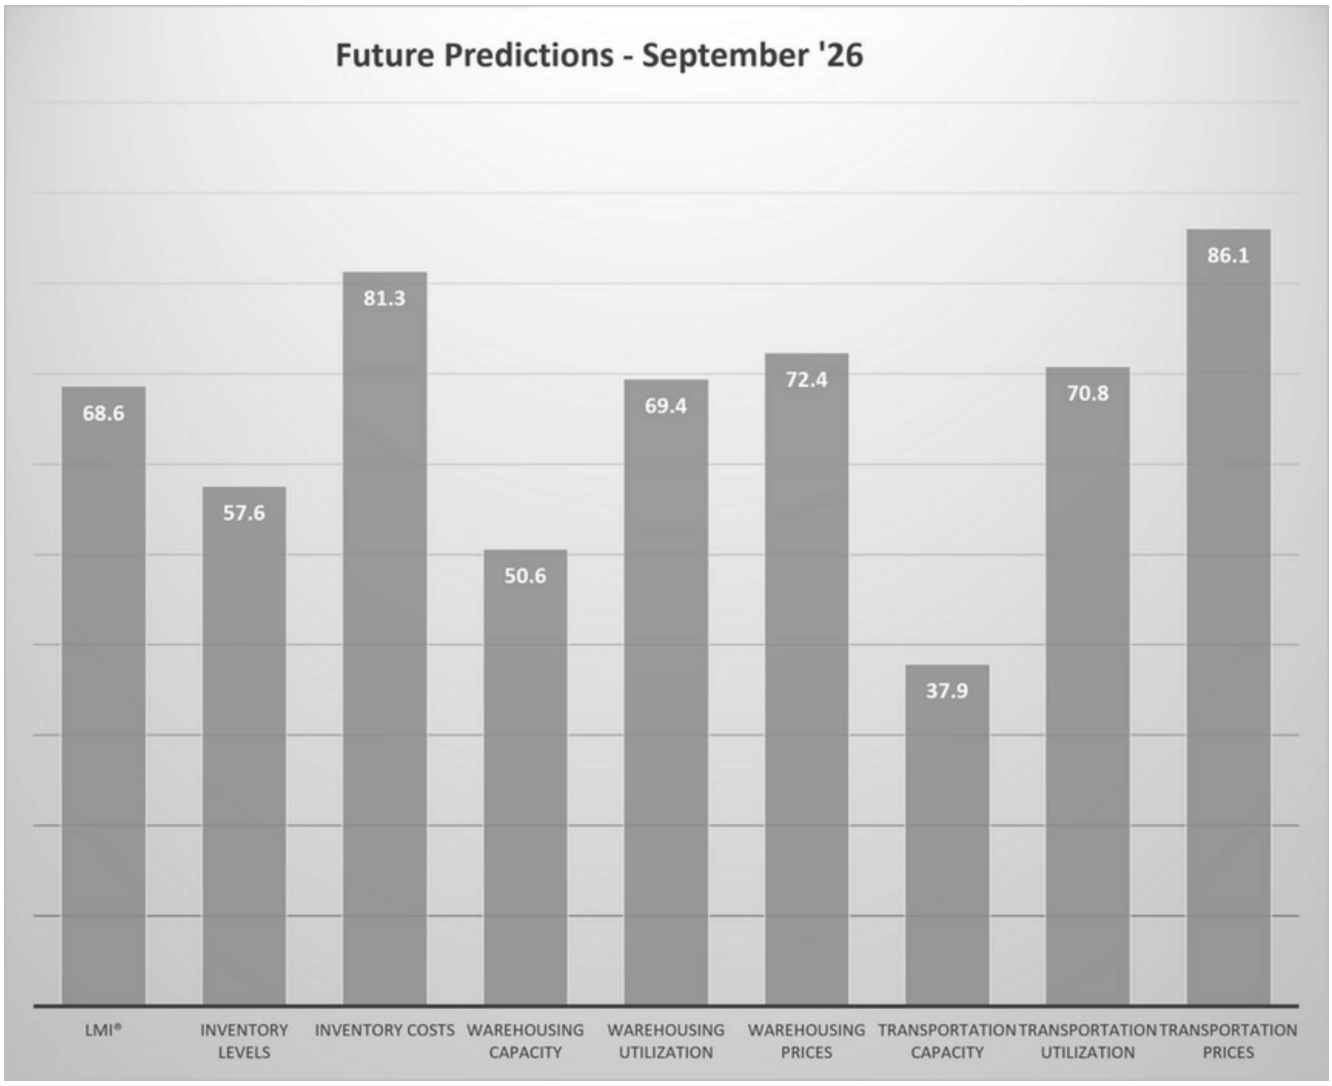

but still expanded at the robust rate of 66.1. Like many metrics in September, this was driven more by Upstream respondents (70.6) than by their Downstream (55.8) counterparts`.

The big logistics (and overall economic) story continues to be the elevated cost of freight. Transportation Prices are up (+2.7) to 92.7. This is the fastest rate of expansion since June and marks five out of the last six months that this metric has come in over 90.0. The expansion can be attributed to what has become an unprecedented expansion in fuel costs. Average U.S. diesel fuel prices read in at $6.832 per gallon in the last week of September, which is the second-highest reading ever – behind only the $6.529 the week before. In fact, the three highest readings ever for average U.S. diesel prices came over last three weeks of September[17]. Prices are up over 70% since the start of the conflict with Iran which had led some U.S. states to offer tax holidays on diesel fuel, retail gasoline, or both[18]. Some U.S. officials have also publicly considered a ban in diesel exports. Keeping the 1.2-1.5 million barrels of diesel the U.S. exports everyday would lead to some relief at home in the short run. However, it would also cause significant disruptions and fuel prices with key trading partners – particularly Mexico, for which U.S. imports make up 55% of their daily diesel usage[19],[20]. Cutting the diesel supply of the U.S.'s largest trading partner in half would likely lead to longer prices in the long run, particularly for manufactured and agricultural products. The Eurozone has significant exposure too as one third of their daily diesel consumption comes from U.S. imports[21]. The high costs of fuel are clearly impacting carriers, as J.B. Hunt warned of a 5-10% earnings headwind in Q3. The spread between the wholesale fuel prices that large carriers pay and the retail price paid by smaller groups has narrowed considerably, indicating that the cost burden borne by larger carriers has increased at a relative level. This is an issue as many large carriers

G-7 in 2026 and echoes the “lean on savings” strategy that China and much of Asia has been utilizing throughout the year[24]. Unfortunately, the drawdown of petroleum reserves has led China to resume restricting exports of diesel, jet-fuel and gasoline – which will likely cause some scrambling for replacements in other Asian countries[25]. The drawdown of reserves is having another interesting effect, as the reduction of petroleum savings is causing some increase in future prices as energy supply chains become more vulnerable to disruption[26]. It is worth noting that oil flows from the Middle East have increased over the last month. While still down from 2023 levels, Suez Canal vessel transits were up 27% year-over-year in August due to more shipping lines being willing to pass through the Red Sea[27]. Some of the increased Red Sea activity can be traced to the repair of a critical Saudi Arabian pipeline. Approximately 12.5 million barrels of crude were loaded into tankers via this pipeline in the last week of September, which could provide some relief to global markets[28].

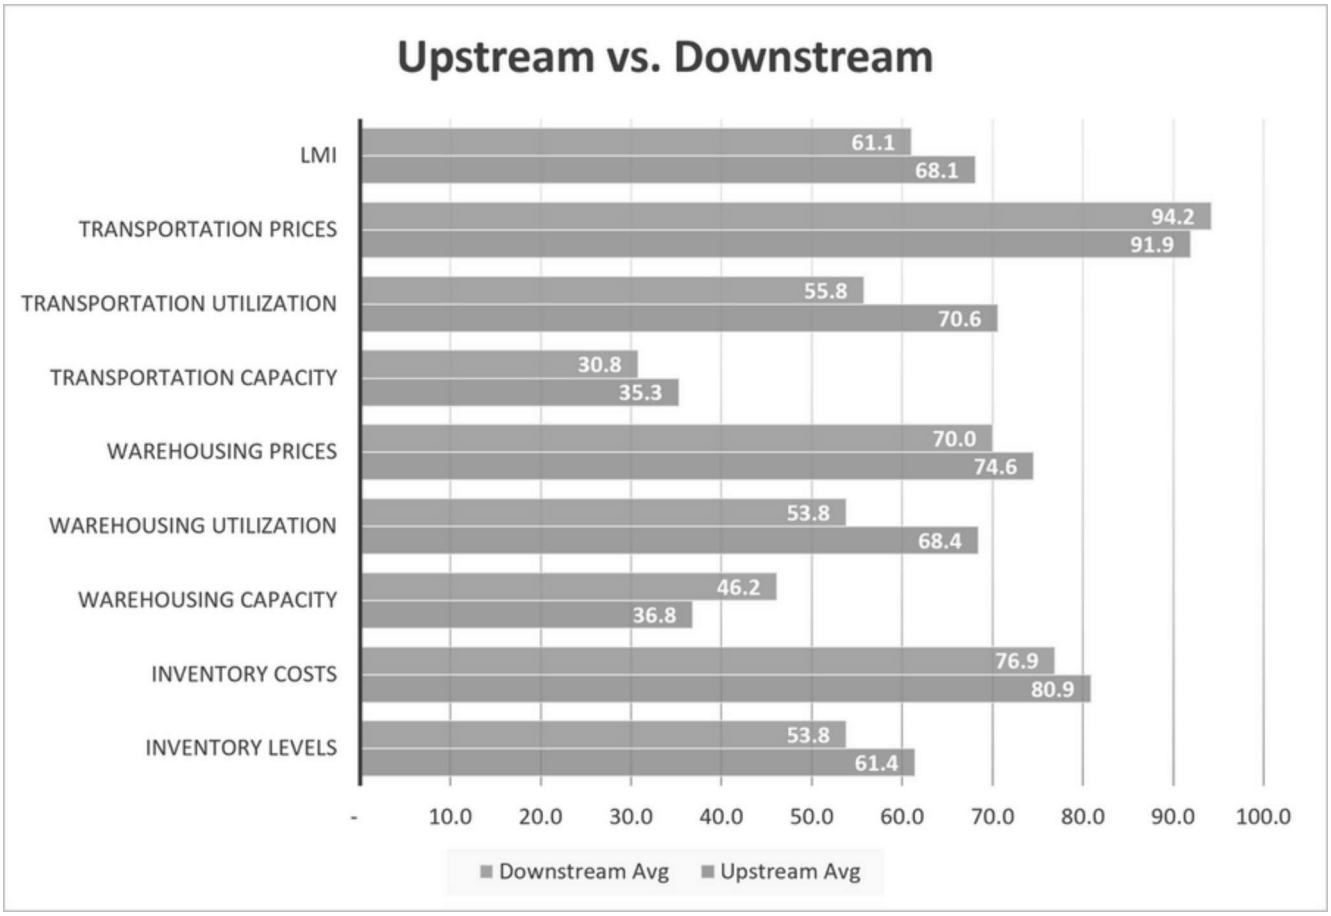

Respondents were asked to predict movement in the overall LMI and individual metrics 12 months from now. Respondent predictions for the overall index are 68.6, down slightly (-1.0) from August’s future prediction of 69.6, and within another point of the future predictions from July (70.5) and June (70.6), demonstrating unusual levels of consistency in forward-looking forecasts of the overall index. That consistency does not extend to future predictions for Inventory Levels, which are predicted to expand, but at a much slower (-10.5) rate than predicted in August – which may reflect the general inventory buildup we have observed over the last month. Despite the expectation of slower Inventory Level expansion, Inventory Cost expansion is anticipated to grow more quickly (+1.7) at a significant rate of 81.3. Respondents also predict slower expansion (-5.0) in Warehousing Capacity at 50.6 which is close to no

LOGISTICS MANAGERS' INDEX

This month, we observe several statistical differences when comparing feedback from Upstream (blue bars) and Downstream (orange bars) respondents. In a reversal from last month, we observe robust Inventory Level expansion (61.4) Upstream and marginally significantly slower expansion (53.8) Downstream. It is possible that these differences reflect seasonal movements

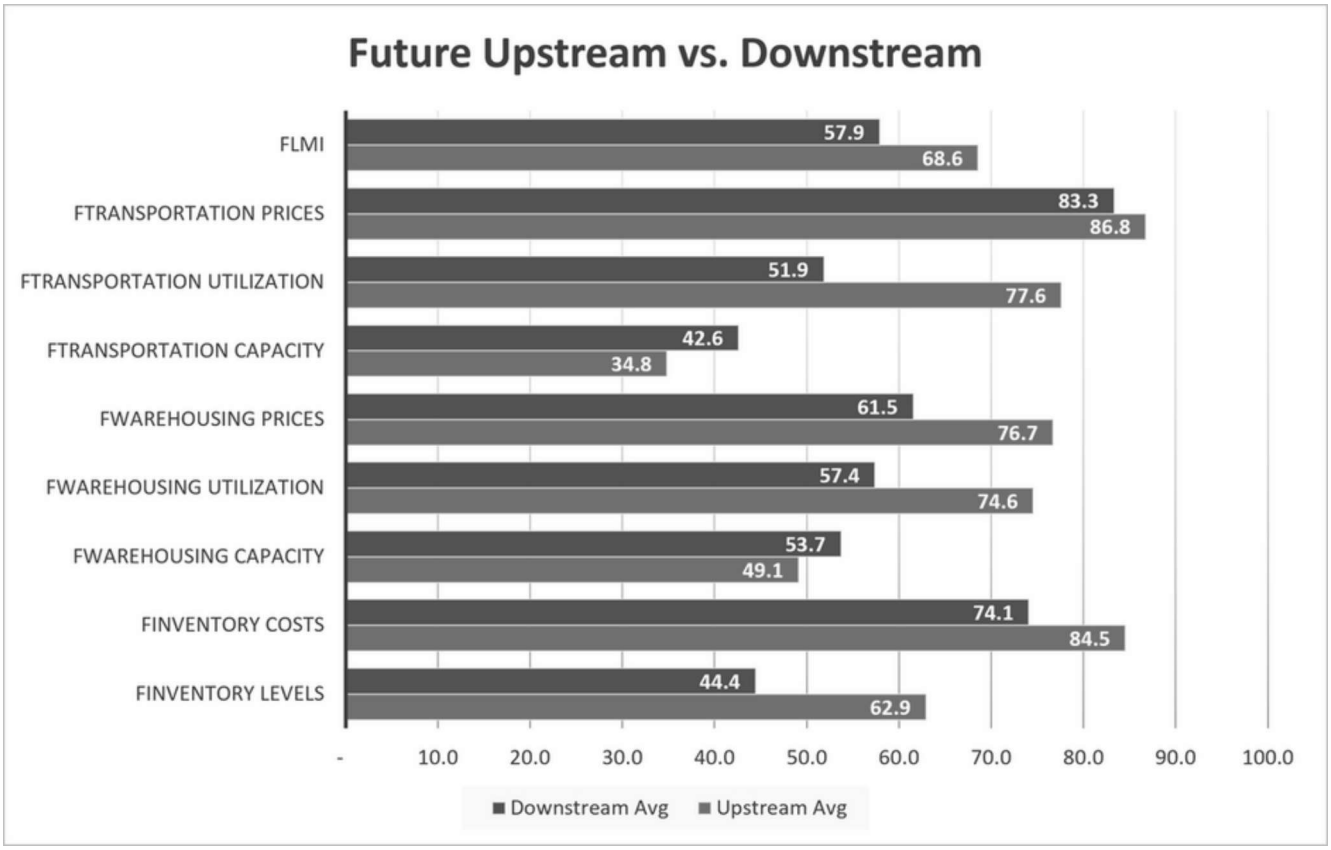

showing robust growth at 70.6 to the more moderate expansion of 55.8 reported by their Downstream counterparts.

	Inv. Lev.	Inv. Costs	WH Cap.	WH Util.	WH Price	Trans Cap	Trans Util.	Trans Price	LMI
Upstream	61.4	80.9	*36.8*	**68.4**	74.6	35.3	**70.6**	91.9	**68.1**
Downstream	53.8	76.9	*46.2*	**53.8**	70.0	30.8	**55.8**	94.2	**61.1**
Delta	7.6	4.0	*9.3*	**14.6**	4.6	4.5	**14.8**	2.3	**7.1**
Significant?	No	No	*Marginal*	**Yes**	No	No	**Yes**	No	**Yes**

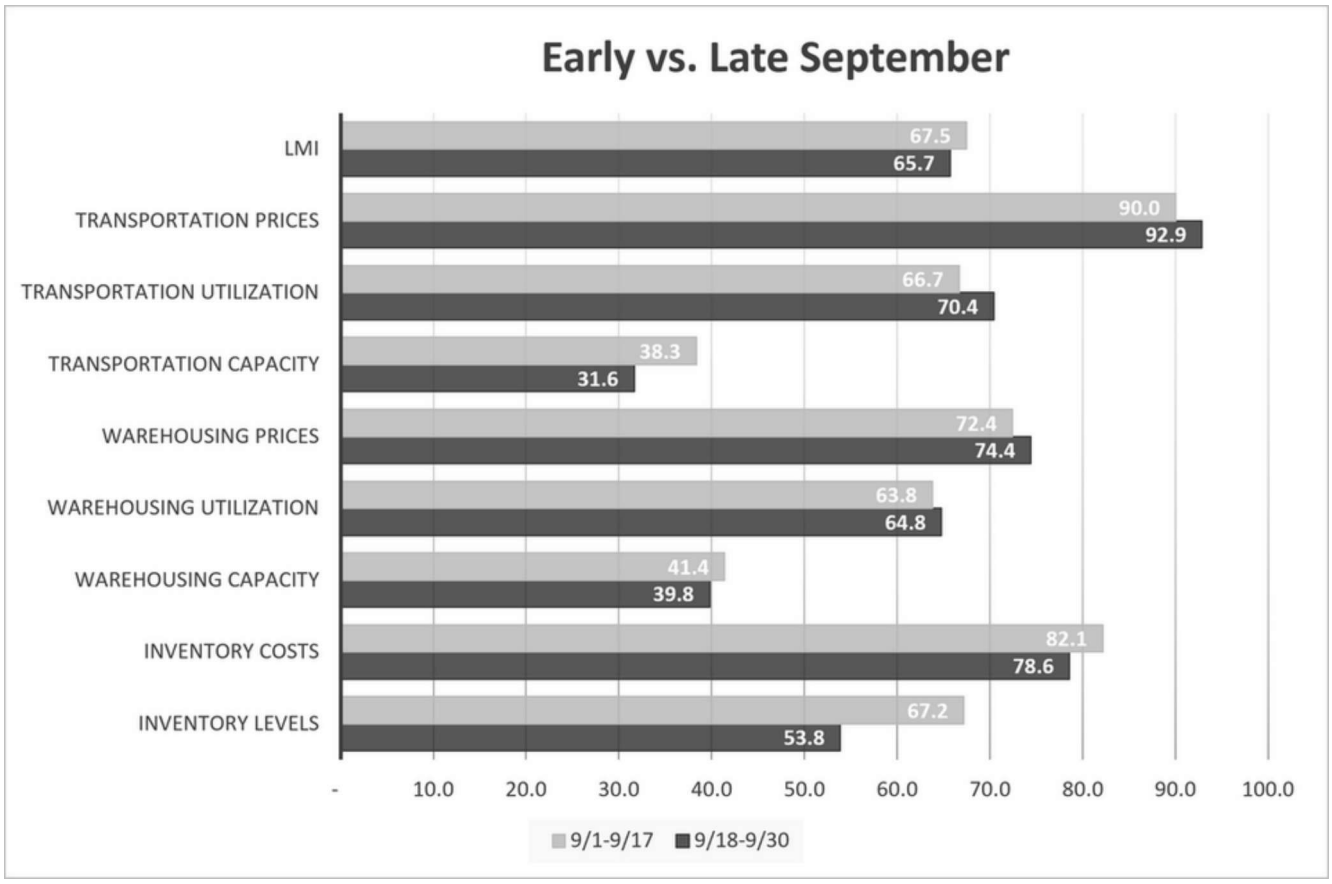

We also split future predictions by Downstream respondents (purple bars) and

adequate space and also pay higher costs to deal with increased inventories. These differences expand to Transportation Utilization as well, which Upstream firms predict to expand (77.6) at a significantly faster rate than Downstream respondents (51.9). Taken together, current and future differences paint a picture of high prices and limited capacity for Upstream firms looking to access logistics infrastructure.

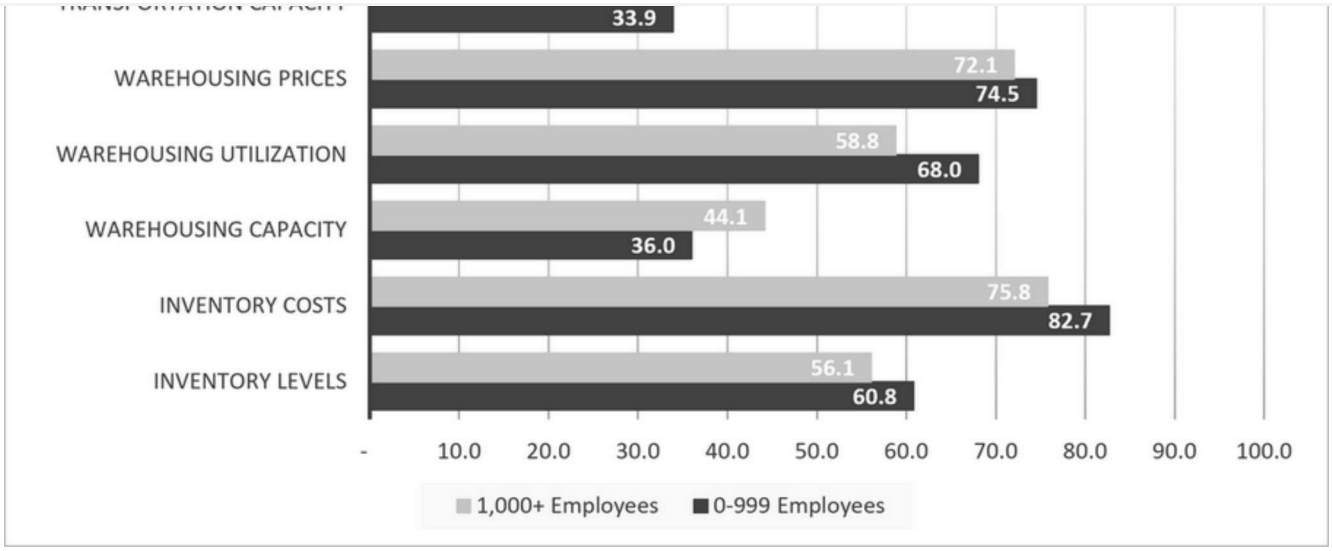

Futures	Inv. Lev.	Inv. Costs	WH Cap.	WH Util.	WH Price	Trans Cap.	Trans Util.	Trans Price	LMI
Upstream	**62.9**	*84.5*	49.1	**74.6**	**76.7**	34.8	**77.6**	86.8	**68.6**
Downstream	**44.4**	*74.1*	53.7	**57.4**	**61.5**	42.6	**51.9**	83.3	**57.9**
Delta	**18.5**	*10.5*	4.6	**17.2**	**15.2**	7.7	**25.8**	3.4	**10.7**
Significant?	**Yes**	*Marginal*	No	**Yes**	**Yes**	No	**Yes**	No	**Yes**

Upstream respondents reported moderate expansion (57.8) over the same period. This split among late month respondents lends some credence to the theory that the inventory that is coming in is sitting Upstream at the wholesale level but will likely matriculate Downstream in the next month. Despite the difference in Inventory Level expansion, there were no other significant differences in any of our other metrics in September.

by gold lines) in September. In a continuation of the last two months, we observe unusual consistency in September, with only one significant difference between what had been our most divergent respondent groups through the first half of 2026. Smaller firms report a significantly faster rate of contraction at 36.0 than their larger counterparts – who report milder contraction at 44.1. While it just misses statistical significance, smaller firms also report notably faster rates of expansion for Warehousing Utilization (68.0) than larger firms (58.8). Taken together, these suggest that smaller firms are having a more difficult time finding adequate storage space than larger firms. Interestingly, there is almost no difference in Warehousing Price.

Employees	Inv. Lev.	Inv. Costs	WH Cap.	WH Util.	WH Price	Trans Cap.	Trans Util.	Trans Price	LMI
0-999	60.8	82.7	*36.0*	68.0	74.5	33.9	66.1	93.2	67.5
1,000+	56.1	75.8	*44.1*	58.8	72.1	35.1	66.2	91.9	64.5
Delta	4.7	6.9	*8.1*	9.2	2.4	1.2	0.1	1.3	3.0
Significant?	No	No	*Marginal*	No	No	No	No	No	No

The index scores for each of the eight components of the Logistics Managers' Index, as well as the overall index score, are presented in the table below. The rate of expansion for the overall index is 70.2, which is up (+3.6) from August's reading of 66.6 and marking a re-acceleration of logistics expansion. This is driven by an increase (+6.1) in the expansion of Inventory Levels, which are now growing robustly after reading in close to no movement at 52.8 last month. This shift suggests that traditional seasonality patterns are holding, with Upstream firms building up inventories in anticipation of shifting them Downstream in Q4. Inventory Costs continue to increase (+1.3) to 79.9, which is the second-fastest rate of expansion for this metric in the last year and likely reflects a combination of high costs due to tariffs and increasing fuel costs. The increase

steadily (-5.6) at 66.1, and Transportation Prices continuing to expand (+2.7) at the meteoric pace of 92.7. With all three cost metrics up, we see Aggregate Logistics Costs increase (+2.5) to 246.1, which represents an elevated level of cost expansion.

LOGISTICS AT A GLANCE					
Index	**September 2026 Index**	**August 2026 Index**	**Month-Over-Month Change**	**Projected Direction**	**Rate of Change**

Historic Logistics Managers' Index Scores

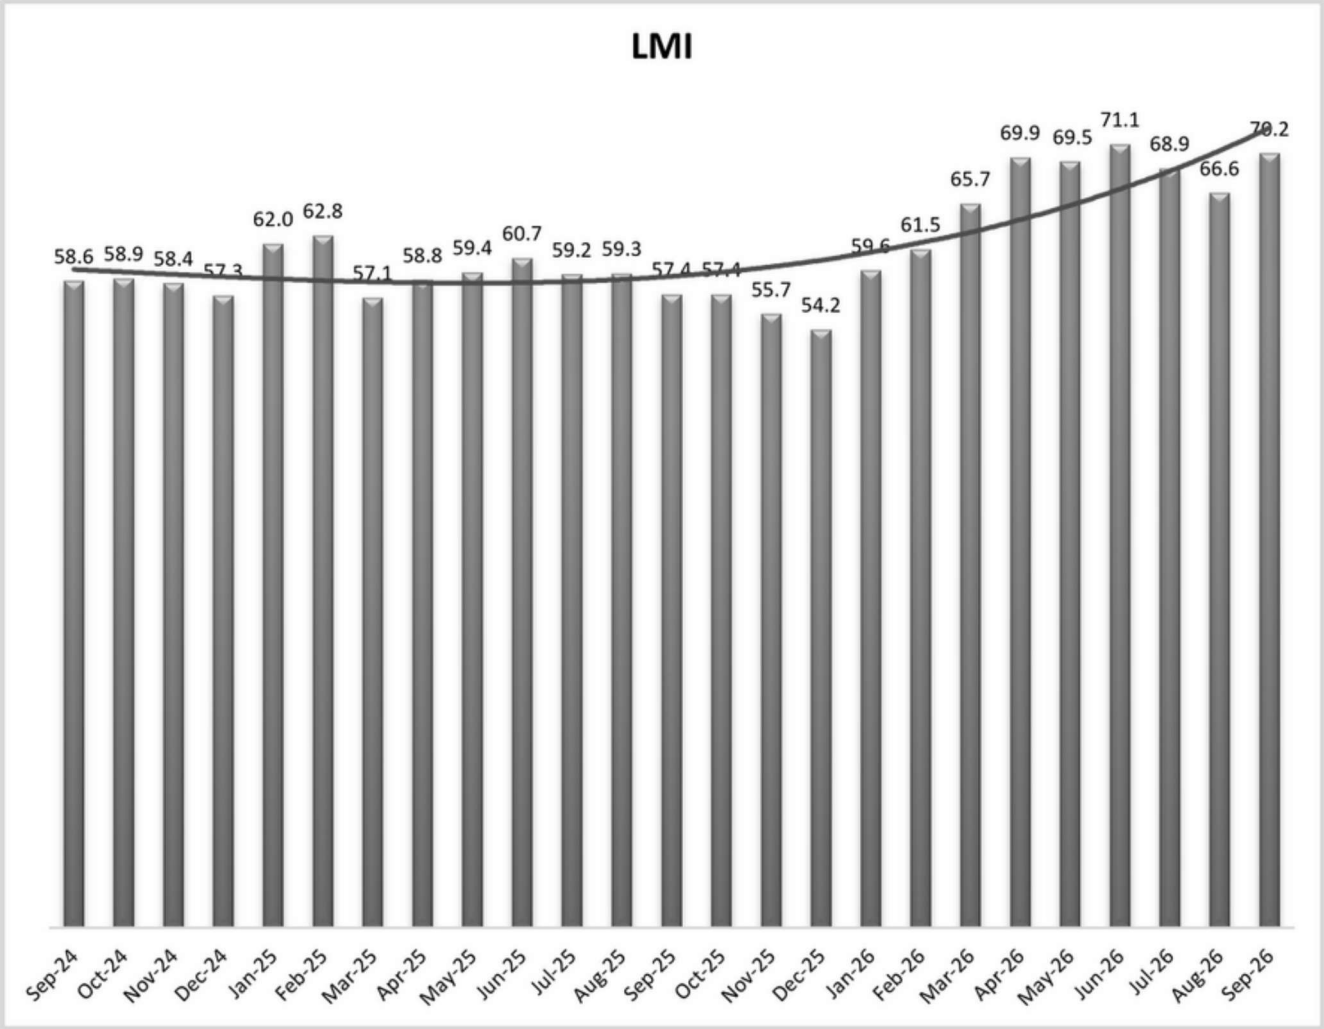

This period's along with prior readings from the last two years of the LMI are presented table below:

Apr '26	69.9
Mar '26	65.7
Feb '26	61.5
Jan '26	59.6
Dec '25	54.2
Nov '25	55.7
Oct '25	57.4
Sep '25	57.4
Aug '25	59.3
July '25	59.2
June '25	60.7
May '25	59.4
Apr '25	58.8
Mar '25	57.1
Feb '25	62.8
Jan '25	62.0
Dec '24	57.3
Nov '24	58.4
Oct '24	58.9
Sep '24	58.6

LMI®

The Logistics Manager's Index reads in at 70.2 in September, up (+3.6) from August's reading of 66.6 in August. This is the second-highest reading since March 2022 and is up 12.8 from a year ago. The index has clearly been impacted by the conflict with Iran, as the average of 68.8 in the six months since the war far outstrips the more modest average reading of 58.5 from the preceding 12

counterparts.

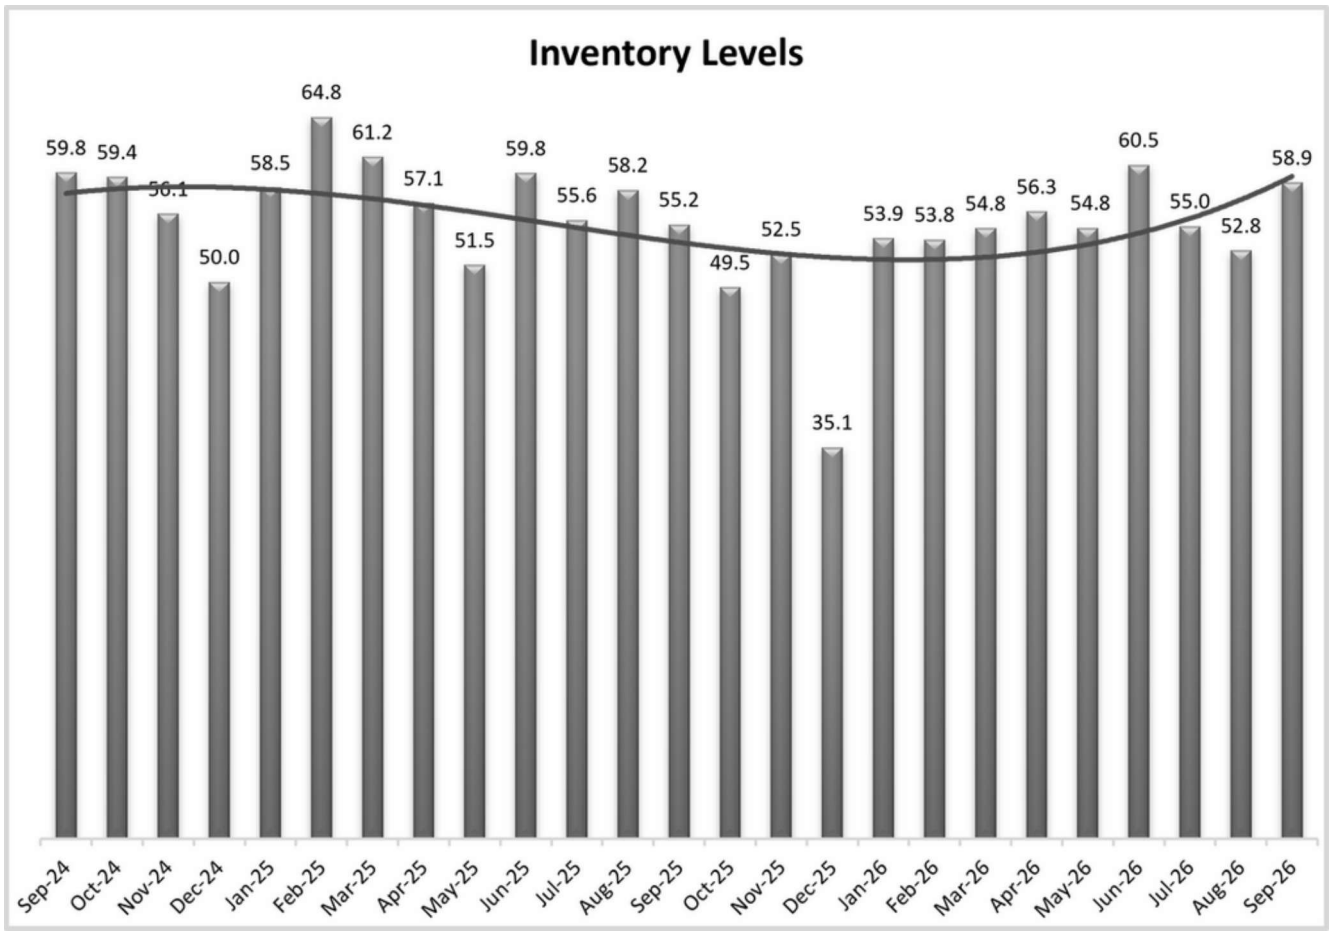

Inventory Levels

The Inventory Level index is 58.9, up (+6.1) from August's reading of 52.8 as goods build up ahead of the Q4 shopping season. Upstream (61.4) and Downstream (53.8) both showed increases in Inventory Levels, although Upstream showed considerably faster growth. By contrast, last month,

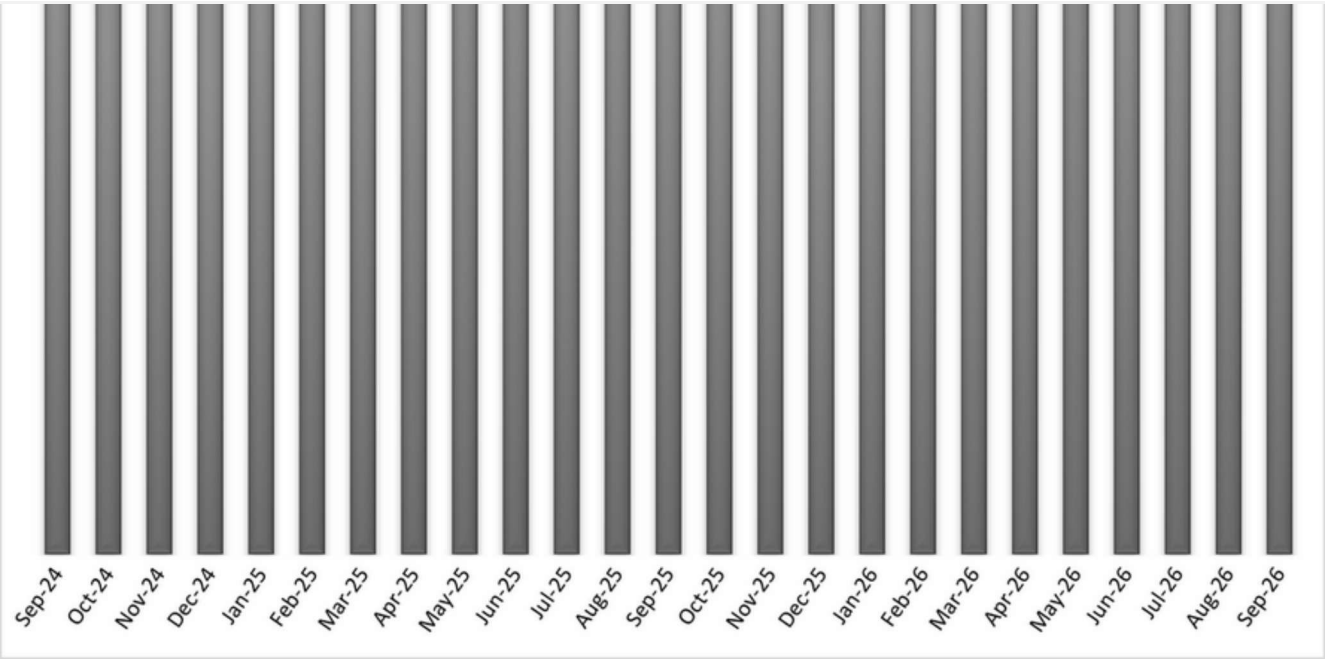

substantial increase in Inventory Levels, and late (48.9) was essentially flat, with a very slight decline.

Increased inventory strategies are reflected in forward-looking predictions. Future Inventory Levels growth is 57.6, down (-10.5) from August's more robust prediction of 68.1 and may be indicative of more normalized seasonal inventory movements in 2027. Upstream firms are expecting faster future expansion in Inventory Levels at 61.4 to the 53.8 predicted by Downstream firms.

Downstream (76.9), early (82.1) respondents and late (78.6), and small (82.7) and large (75.8) respondents all report significant rates of expansion, suggesting the Inventory costs are up across the board.

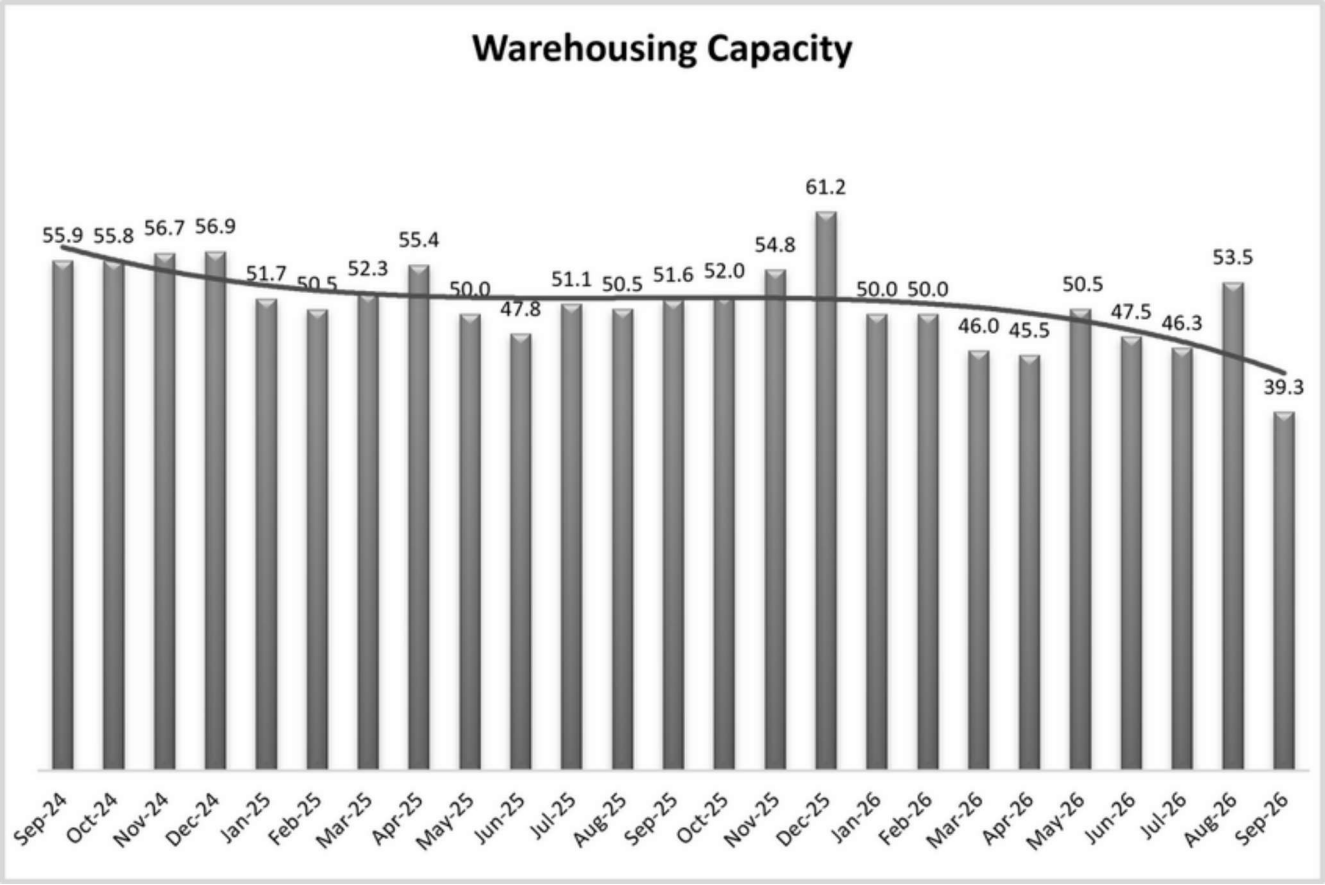

Predictions for future Inventory Cost growth are 81.3, up (+0.7) from August's future prediction of 79.6 and suggesting that Inventory Costs will expand even faster over the next year. Expectations for future increases are up across the supply chain, but Upstream firms do expect marginally significantly faster expansion at 84.5 relative to the still-high Downstream prediction of a 74.1.

Warehousing Capacity

The reading for Warehousing Capacity for September 2026 reversed (rather dramatically) its previously expanding position where it registered in at 39.3 reflecting a 14.2 -point decrease from the month prior. This reading is down (-12.3) from the reading one year ago and is down by (-16.6) from the reading two years ago. There was a 9.3-point split between Upstream (36.8) and Downstream (46.2) in September, where Downstream slipped from neutrality and entered contraction, where Upstream also reversed and entered rather sharply into contraction. This difference was not statistically significant (p>.1), and notable that the Upstream value entered back into contraction. Comparing the differences between small (<999 employees) and large (>999) employees we see that there is an 8.1-point difference between the two at 36.0 and 44.1, with a 20-point downward shift in small firms, and a nearly 6-point drop in larger firms, both entering contraction. This difference was marginally statistically significant (p <.1).

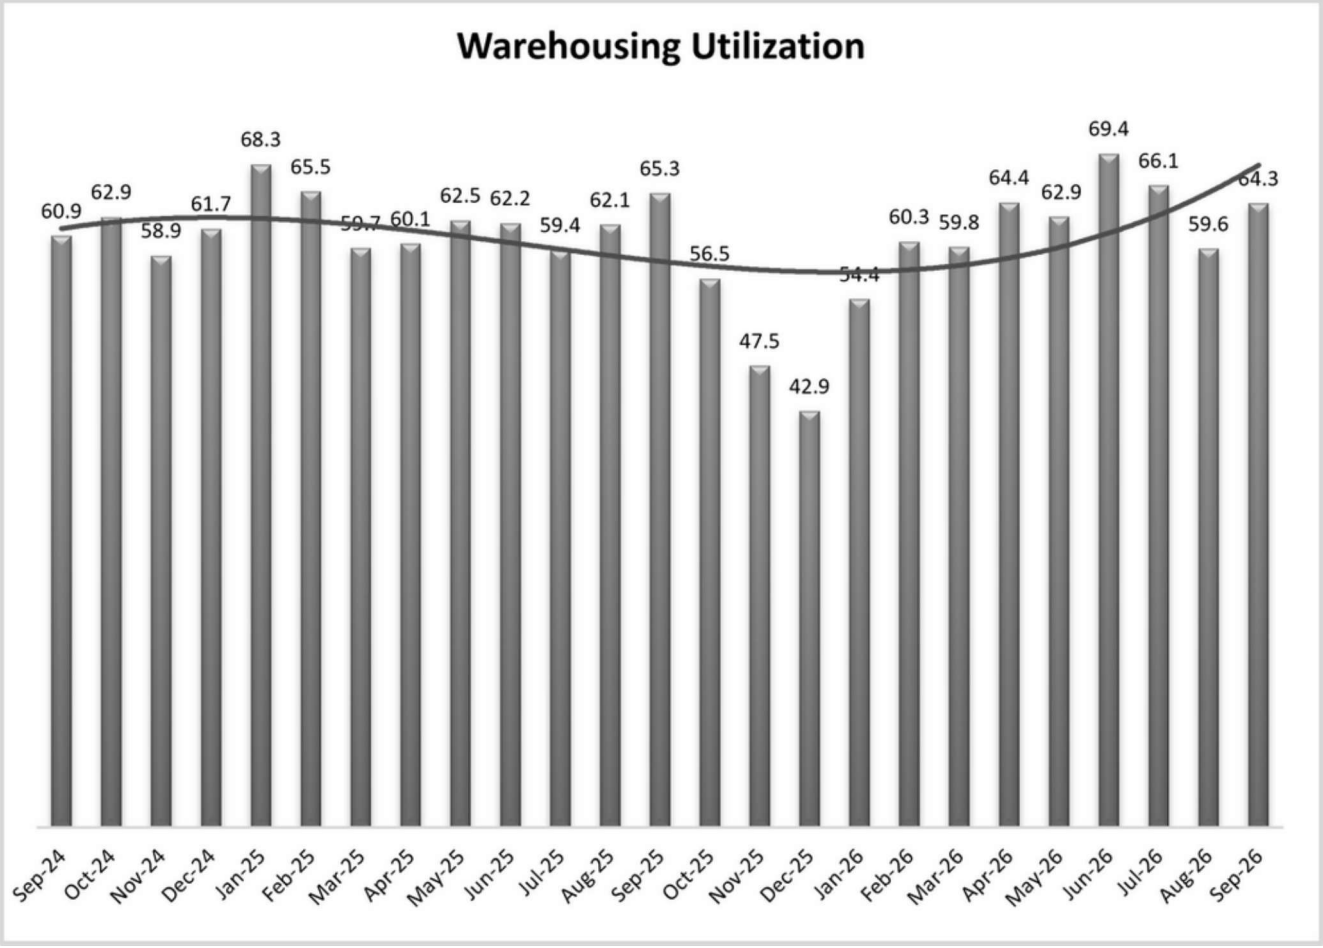

statistically significant (p>.1).

Warehousing Utilization

The Warehousing Utilization index registered in at 64.3 points for the month of September 2026, reflecting a 4.7-point increase from the month prior, remaining in expansionary territory with a slight growth. This reading is down 1-points from the reading one year ago, and up by 3.4-points from the reading two years ago. In addition, there was a 14.6-point split between Upstream (68.4) and Downstream (53.8), with this difference being statistically significant (p<.05). Comparing the differences between small (<999 employees) and large

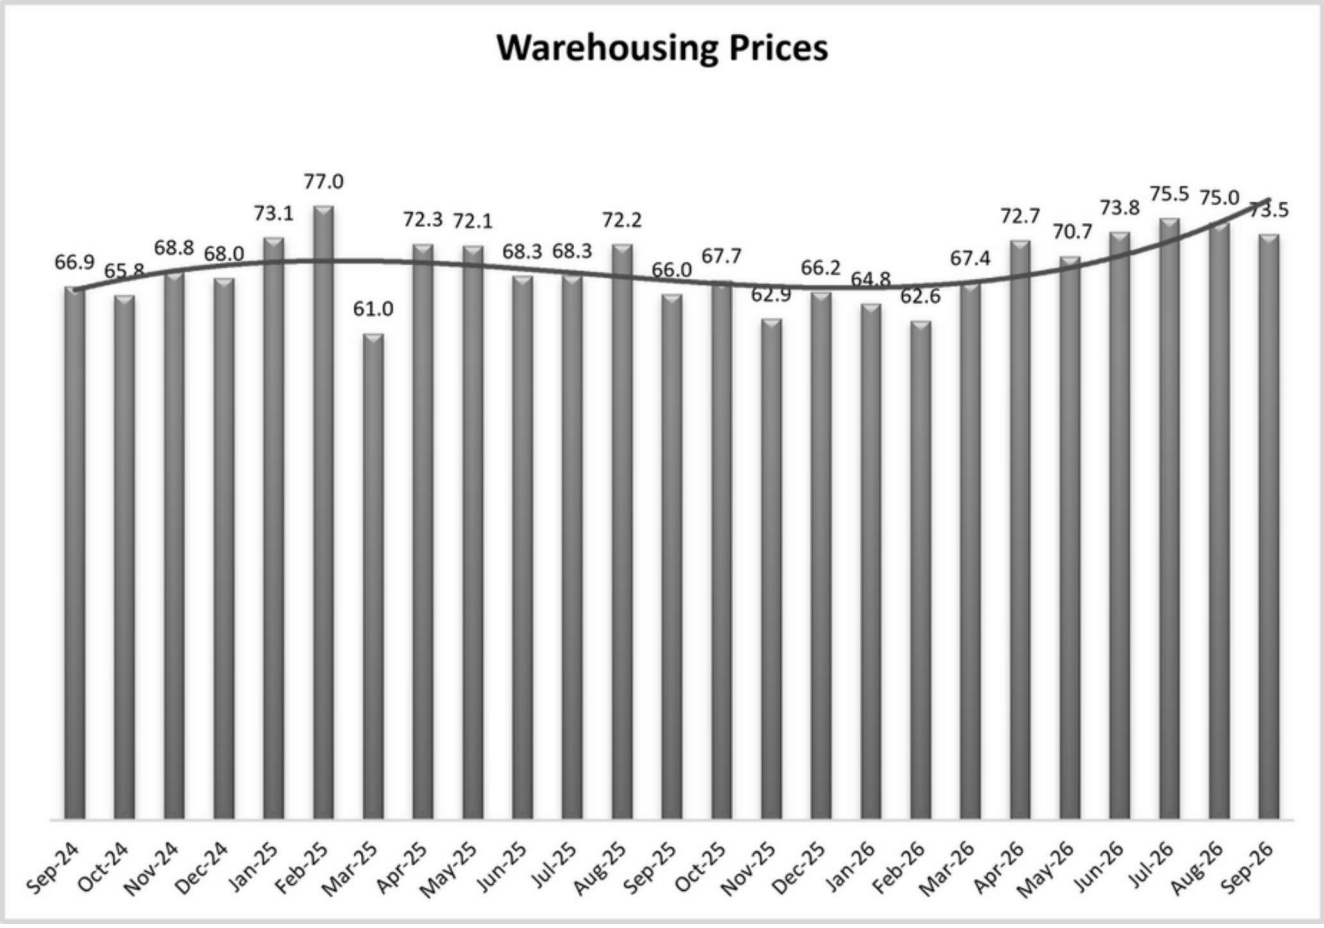

with future Upstream expectations (76.7 and up from last month) predicted to be growing at a faster rate than Downstream expectations (57.4 and down from last month) where this 17.2-point difference was statistically significant (p<.05).

Warehousing Prices

The Warehousing Pricing continues its upward rise, albeit with a modest slip (2 months in a row now), where pricing decreased by 1.5 points to 73.5. for September 2026. This reading is up 7.5 points from the reading one year ago, and up 6.6 -points from the reading two years ago. In addition there was a 4.6 -

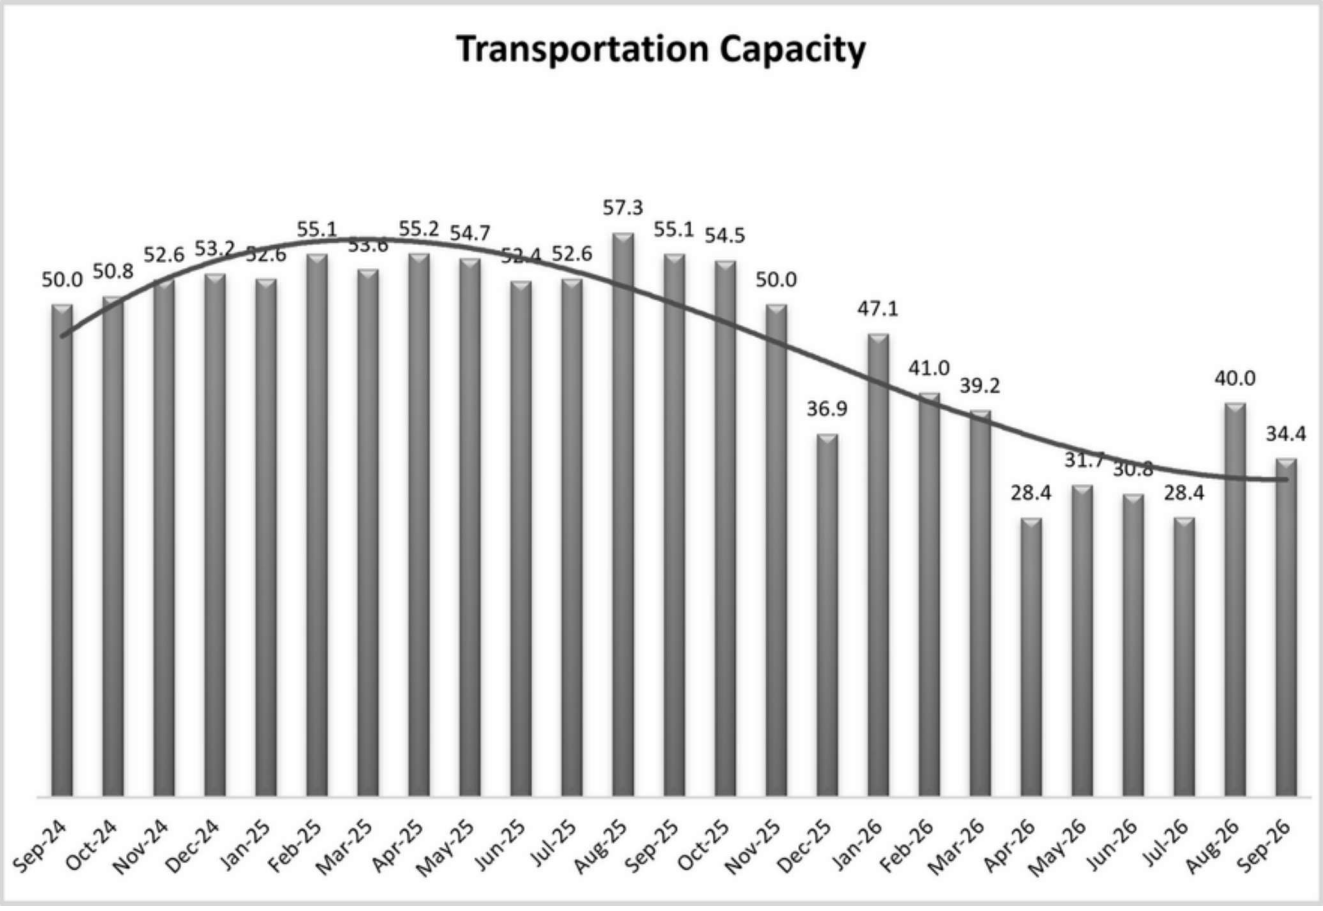

robust expansion at 72.4, which is down (-6.8) from August's prediction of 79.2 but still indicates a significant rate of price expansion. Expectations across the supply chain are elevated but also split, with future Upstream expectations (76.7 and decreased from last month) being predicted to be increasing, at a faster rate than Downstream expectations (61.5, also decreased from last month). This month's 15.2-point difference was statistically significant (p<.05).

Transportation Capacity

The Transportation Capacity Index dropped 5.6 points to 34.4 percent in September 2026. With this drop, the Transportation Capacity index continues

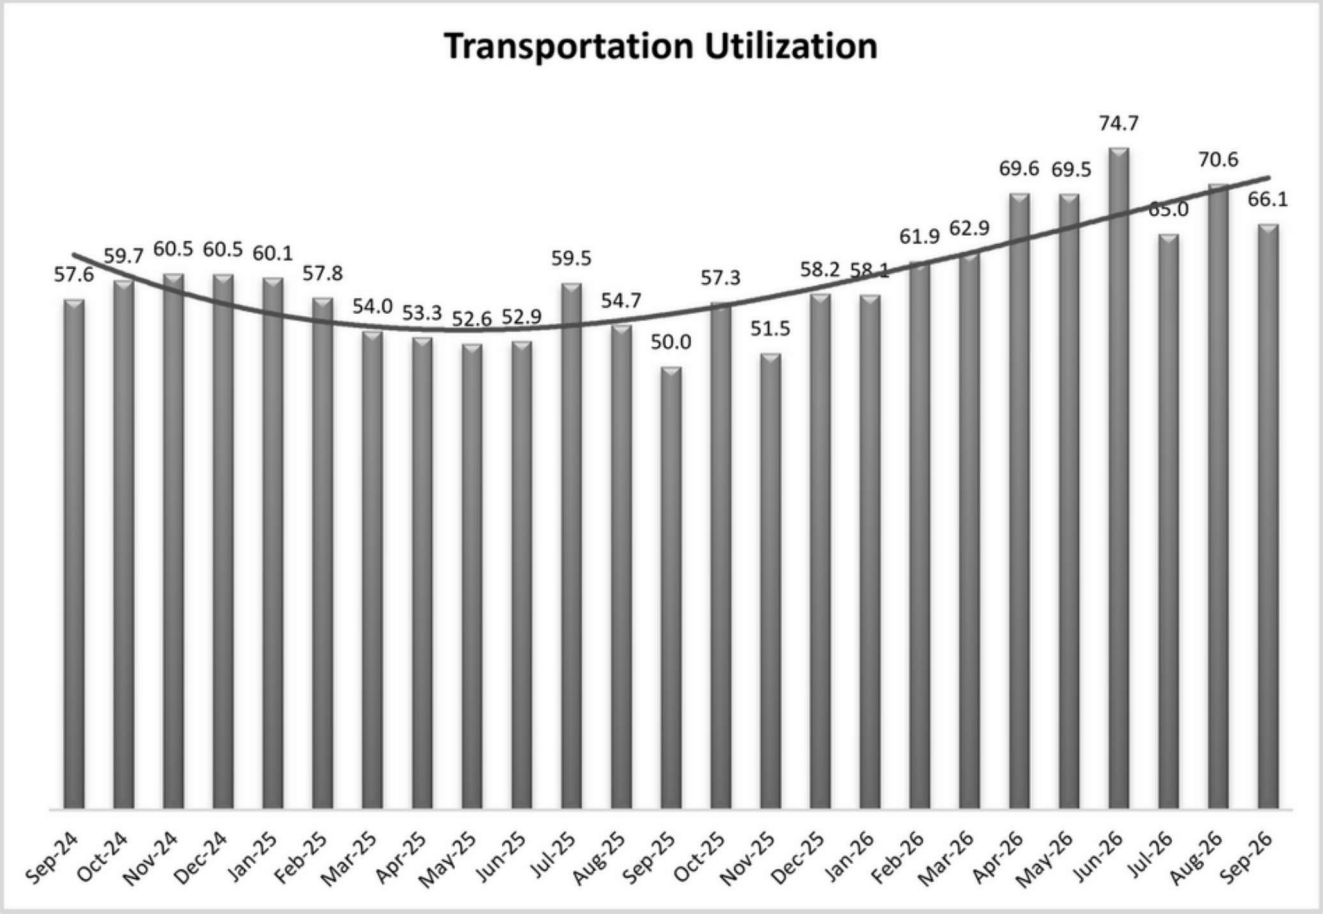

indicates 37.9, representing continued expectations of capacity contraction for the next 12 months. While the future Upstream index is at 34.8, the Downstream Transportation Capacity index is at 42.6, but the difference is not statistically significant. As such, expectations of contraction in future Transportation Capacity are present are distributed relatively uniformly across the supply chains.

Transportation Utilization

The Transportation Utilization Index decreased 4.5 points, indicating 66.1 in September 2026. With this decrease, the Transportation Utilization index drops

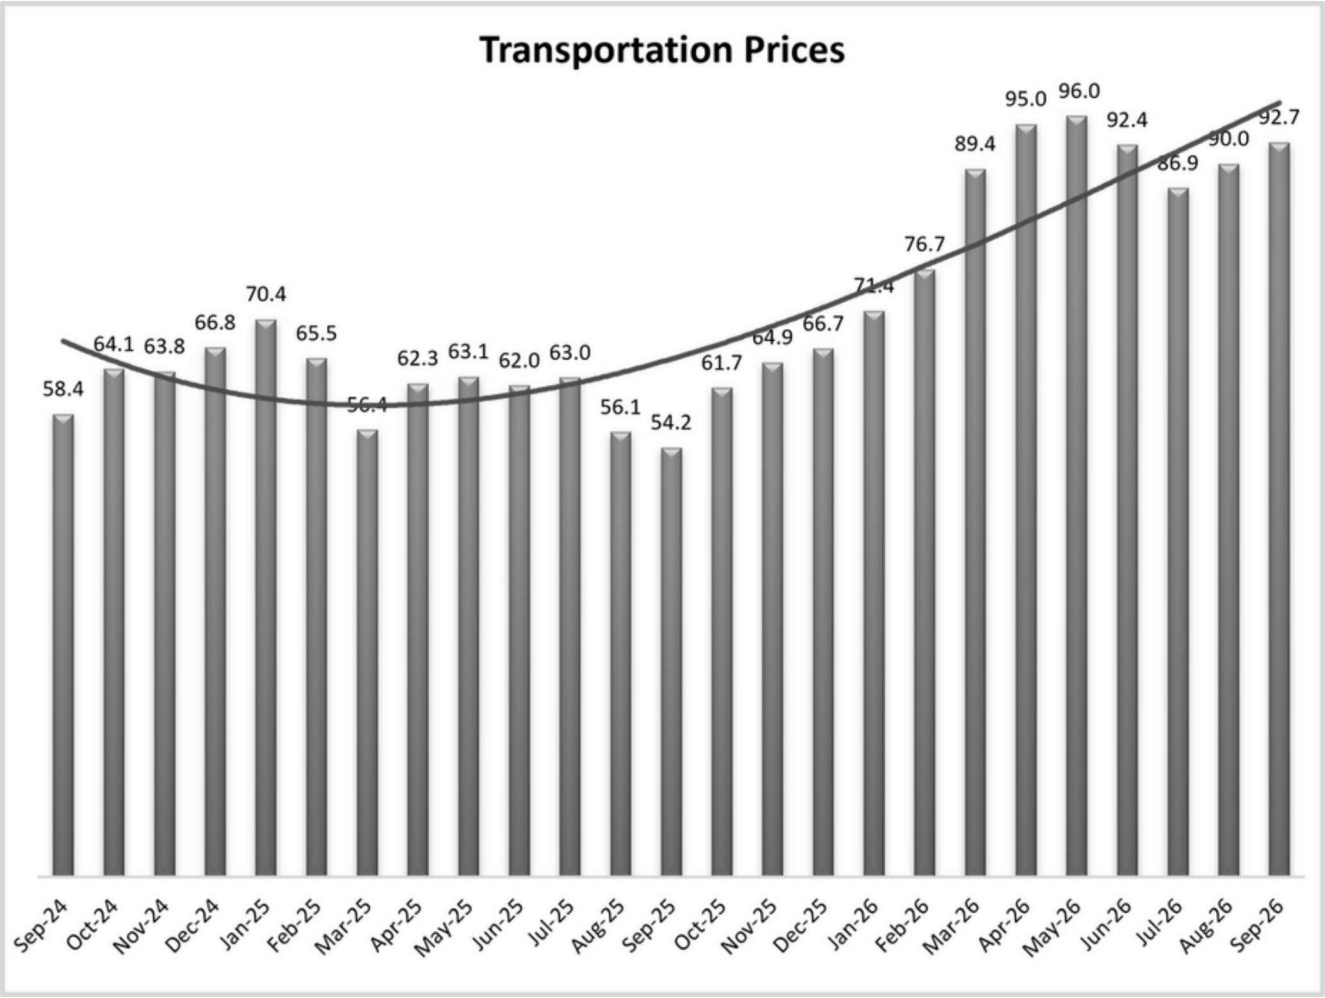

indicating 70.8 for the next 12 months. The future Upstream Transportation Utilization index is at 77.6 and the Downstream index at 51.9 and the difference is statistically significant. As such, it can be concluded that expectations of increased Transportation Utilization are much stronger Upstream than Downstream.

Transportation Prices

The Transportation Prices Index increased 2.7 points from the previous reading and recorded 92.7in September 2026. With this increase the Transportation

The future index for Transportation Prices remained steady at 86.1, continuing to represent strong expectations of price increases for the next 12 months. The future Upstream Transportation Prices index is at 86.8 while the Downstream Transportation Prices index is at 83.3, but the difference is not statistically significant. Therefore, inflationary expectations in Transportation Prices remain extremely strong across the US supply chains, both Upstream and Downstream.

Data and Method of Presentation

Data for the Logistics Manager's Index is collected in a monthly survey of leading logistics professionals. The respondents are CSCMP members working at the director-level or above. Upper-level managers are preferable as they are more likely to have macro-level information on trends in Inventory, Warehousing *and* Transportation trends within their firm. Data is also collected from subscribers to both DC Velocity and Supply Chain Exchange as well. Respondents hail from firms working on all six continents, with the majority of them working at firms with annual revenues over a billion dollars. The industries represented in this respondent pool include, but are not limited to: Apparel, Automotive, Consumer Goods, Electronics, Food & Drug, Home Furnishings, Logistics, Shipping & Transportation, and Warehousing.

Respondents are asked to identify the monthly change across each of the eight metrics collected in this survey (Inventory Levels, Inventory Costs, Warehousing Capacity, Warehousing Utilization, Warehousing Prices, Transportation Capacity, Transportation Utilization, and Transportation Prices). In addition, they also forecast future trends for each metric ranging over the next 12 months. The raw data is then analyzed using a diffusion index. Diffusion Indexes measure how widely something is diffused or spread across a group. The Bureau of Labor Statistics has been using a diffusion index for the Current Employment Statics program since 1974, and the Institute for Supply Management (ISM) has been using a diffusion index to compute the Purchasing Managers Index since 1948. The ISM Index of New Orders is considered a Leading Economic Indicator.

We compute the Diffusion Index as follows:

say it is increasing, we would calculate an index value of 0*0.25 + 0.5*0.38 + 1.0*0.37 = 0 + 0.19 + 0.37 = 0.56, and the index is increasing overall. For an index value above 0.5 indicates the category is increasing, a value below 0.5 indicates it is decreasing, and a value of 0.5 means the category is unchanged. When a full year's worth of data has been collected, adjustments will be made for seasonal factors as well.
